Prepared by: Scott P. Greiner, Extension Animal Scientist, Beef
& Joi Saville, Extension Associate
Virginia Tech, Blacksburg, Virginia

Central bull testing programs for the performance evaluation and marketing of Virginia Beef Cattle Improvement Association member's bulls were carried out at two test stations located at Culpeper and in Southwest Virginia during the test season 2016-17. One test group was developed at the Culpeper location and two test groups were developed at the Southwest location, and a total of two sales held.

I. CULPEPER

This was the 59th consecutive year of evaluating bulls at the Culpeper station. Virginia BCIA contracted with Glenmary Farm at Rapidan, Virginia to furnish development facilities, and provide complete care and management for a Senior group of bulls. The Culpeper Senior Bull sale was held at the Culpeper Agricultural Enterprises at Culpeper, Virginia. Virginia BCIA handled consignments, set rules, regulations and performance standards and certified records, and generally supervised the tests and sales, utilizing a committee composed of interested consignors with John Prekker serving as Chair.

(1) THE BULLS AND THE MANAGEMENT

Eighteen Virginia BCIA members including: 15 Virginia, 1 Maryland, and 2 West Virginia breeders tested bulls. Eighty-five total Senior bulls (calved Aug. 15 to Nov. 30, 2015) and 2 custom bulls were delivered to Glenmary Farms June 28, went on 112 day test July 12 and came off test November 2, 2016. Bulls accepted for test were required to have a WDA of 2.5 pounds at delivery (with allowable shrink), and have a minimum YW EPD based on breed (Virginia Quality Assured Feeder Calf Program genetic standards). Each bull had a negative Brucellosis and TB test or was from a certified and accredited herd (Virginia bulls not required to have TB test), negative anaplasmosis test, negative PI BVD test, and was inoculated for Clostridial diseases, IBR, PI3, BVD, BRSV, and Haemophilus Somnus before delivery. Upon arrival at the test station bulls received a MLV intranasal IBR/PI3 vaccination, and were boosted for 7-strain clostridial and treated for internal and external parasites with an endectocide product. At the beginning of the official test (14 days after arrival) all bulls received a booster of MLV 5-way viral product (IBR, BVD Types I and II, PI3, BRSV). To be sale eligible bulls had to have a minimum frame score of 5.0, meet minimum YW EPD requirements as specified by the Virginia Quality Assured Feeder Calf Program, pass a breeding soundness exam (including semen evaluation as per Society for Theriogenology). Additionally, a committee evaluated all bulls for structural soundness and bulls found to be unacceptable structurally were not sold. A Sale Index comprised of 2/3 station index (station index = 2/3 yearling weight ratio + 1/3 test ADG ratio) and 1/3 average EPD percentile (20% CE EPD, 20% WW EPD, 20% YW EPD, 20% MM EPD, 10% MB EPD, 10% REA EPD) was used to eliminate additional bulls to arrive at the number eligible for the sale. Additionally, bulls were required to be free of the genetic defects recognized by their respective breed associations (bulls DNA-genotyped as necessary as part of the test). Coat color genotype was performed on Gelbvieh, Simmental and Simmental Hybrid bulls as needed. Approximately 70% of the bulls in each group were cataloged for the sale. A portion of the bulls not qualifying for the sale were sold for slaughter at the conclusion of each test. Two breeders consigned a total of two Senior custom test bulls.

(2) RATIONS

Rations were formulated in cooperation with Virginia Tech Extension Animal Scientists. The feed was furnished by Glenmary Farm (raised or purchased). Feed ingredients were charged at cost, plus a mark-up per ton of finished feed. Rations were formulated to contain 74% TDN and 14% crude protein (dry basis). Bulls were fed daily in fence-line feed bunks.

The following ingredients comprised the majority of the Senior ration: corn silage, high moisture corn, and distillers grain. Ingredients were included based on availability and price. Chlortetracycline was fed during the warm-up period. A complete mineral containing an ionophore was included in the total mixed rations.

(3) PERFORMANCE EVALUATION

Bulls were weighed at 56 days and each successive 28 days. Ultrasound evaluation for fat thickness, ribeye area and percent intramuscular fat was conducted near the end of test. All ultrasound data was processed through a centralized ultrasound processing laboratory and submitted to respective breed associations. At the end of the test bulls were weighed, measured for hip height, evaluated for structural soundness, and had a complete breeding soundness exam, including a semen evaluation. At the end of the test, 26 Senior bulls were removed from the sale groups based on failure to meet one or more minimum performance standards, soundness criteria, or were retained for home use. The remaining 56 bulls were cataloged.
